Remote, based in Poland (CET)

Profile

Full-stack engineer with more than ten years building reliable, scalable web applications across e-commerce, mobility, SaaS and marketing technology. Equally deep in two backend stacks, Laravel and Node.js, paired with Vue or React, and with Filament, Nova or Backpack for admin work.

Most of my architecture work comes down to domain-driven design and CQRS: drawing the boundaries in a tangled monolith so it can be scaled, observed and changed one piece at a time. When a workload outgrows PHP or Node I move that specific path to Go or Rust and leave the rest alone. When a product needs to leave the browser, I ship it in React Native or Flutter on the same API.

Alongside the code I lead teams: setting the architecture, keeping it intact through code review, mentoring developers into owning a domain, and turning loose requirements into specifications a team can build from.

Measured results

Client engagements; figures as measured at the time

- 55%** **faster queries, 20% lower peak-hour load.** Split a large domain into CQRS microservices with dedicated read models.
- <500ms** **page loads, down from roughly three seconds.** Profiled the real request path, removed N+1 queries, added the missing indexes, cached at the layer that mattered.
- 4×** **peak traffic on the same infrastructure.** Slow work moved to queues, read models and horizontal scaling added, Octane and Swoole on the hot path.
- 40%** **lower cloud spend.** Right-sized instances, repaired cache hit rates, compiled services on the hottest paths.
- <100ms** **catalogue search.** Elasticsearch with tuned relevance, faceting and incremental indexing.
- 10%+** **higher checkout completion.** Instrumented the funnel, cut steps and round-trips, fixed mobile performance and error handling.
- 90%** **fewer failed background jobs.** Idempotent handlers, retries with backoff, dead-letter queues, alerting on queue health.
- 50%** **less development time.** Domain-driven design and shared patterns, so new features build on existing components instead of re-implementing them.
- 40%** **less tracked technical debt.** Coding standards and review rules adopted across teams, with the debt backlog burned down on a schedule.
- 70%** **faster deployments.** CI/CD pipeline optimisation, zero-downtime releases, fast rollback.
- 70%** **faster project setup.** Project templates and Docker environments that give a new codebase CI, linting and deploys on day one.
- 45%** **better UX metrics.** Image recognition, speech and document parsing built in with Cloud Vision, Amazon Rekognition and Polly, IBM Watson and OpenAI.
- 20h** **of manual work removed each week.** Filament, Nova and Backpack panels built around the real workflow, with automation behind them.
- minutes** **to root cause, where it used to take hours.** Structured logs, metrics and traces from day one, with alerts tuned so each one is worth acting on.

Experience

- Full-stack developer** *Software development agency* Nov 2021 – present
Web applications and e-commerce platforms in Magento 2, PrestaShop and Laravel. Planned solution architecture, estimates and delivery timelines; set architectural standards and reviewed code across projects.
- Full-stack developer** *IT services company* Jun 2018 – Nov 2021
Built and maintained more than ten web applications for clients in different countries and business domains, choosing the stack for each. Led performance work, integrations and technical decisions on long-running products.
- Back-end developer** *Web development studio* Aug 2017 – Jun 2018
Delivered PrestaShop and WordPress sites end to end: custom themes, plugins and modules, payment and shipping integrations, and SEO work.
- PHP developer** *Freelance* Sep 2015 – Aug 2017
Built and supported WordPress and Yii2 sites from start to finish for international clients, including custom themes and modules.
- Founder** *Own web products, SEO and lead generation* Sep 2011 – Aug 2017
Launched and grew a portfolio of sites and web services from concept to monetisation, on custom PHP and CMS platforms.

Projects

Client names withheld under NDA

- Enterprise mobility and ride-hailing platform** team of 9
Designed the solution architecture and kept it intact through code review and technical guidance. Implemented CQRS microservices, real-time communication over WebRTC and WebSockets, and AI document recognition for driver onboarding. Led the development team and owned specifications, estimation and technical risk.
Laravel Nova, Vue 3, Node.js, NestJS, Octane, WebRTC, WebSockets, CQRS microservices, RabbitMQ, PostgreSQL, Redis, AWS, Docker
- Custom form builder and print fulfilment platform** team of 7
Architected a drag-and-drop form builder with a conditional logic engine for product personalisation, and a Canvas-based PDF template system with real-time preview. Built semi-automated order processing for print file distribution, plus hybrid mobile and PWA apps on web components.
PrestaShop, TypeScript, Web Components (Lit), PWA, Canvas, jQuery, MySQL, AWS, Docker
- High-volume e-commerce and marketplace platform** team of 3
Built computer-vision document and recipe recognition into the storefront, custom shipping and accounting integrations, subscription services, a PDF generation system and multi-carrier re-shipment flows. Optimised checkout and implemented custom cart pricing rules.
Magento 2, Knockout.js, Elasticsearch, MySQL, Redis, AWS, Docker
- Agency CRM, HRM and SEO audit platform** team of 4
Delivered a combined CRM and HRM system with time-tracking integration, and a B2B platform running automated SEO audits against third-party backlink and authority APIs. Engineered the data collection pipeline on Google Cloud SQL and BigQuery, and led performance optimisation.
Laravel Nova, Laravel Horizon, Vue 2 (Nuxt.js), MySQL, BigQuery, AWS, Docker
- E-commerce platform migration** team of 3
Led research, estimation and delivery planning for a theme migration onto a modern Node.js and Stencil toolchain, which unlocked the GraphQL API. Modernised the API integration, added editable theme sections and premium product filtering, and raised the store's conversion rate.
BigCommerce, Stencil CLI, Node.js, GraphQL

Open source

filament-studio

[serhii-f8/filament-studio](#)

Dynamic data model manager for Filament. Build and evolve data models at runtime, without migrations: EAV storage, 33 field types, dashboards and multi-tenancy in a single Laravel plugin.

Laravel, Filament, PHP, EAV, multi-tenancy, Blade, TypeScript

vadd

[serhii-f8/vadd](#)

Verification-driven development for coding agents. A local dashboard that turns agent output into structured decisions and evidence, isolates every objective in its own git worktree, and refuses to mark work finished until the verification commands have run green. That rule lives in the state machine, so the interface cannot bypass it. No telemetry, no outbound requests.

TypeScript, Node.js, pnpm monorepo, schema-validated events, state machines, Vitest

Toolkit

PHP	Laravel, Symfony, Filament, Laravel Nova, Backpack, Horizon, Octane
Node	Node.js, TypeScript, NestJS, Express, Fastify, Prisma, pnpm workspaces, Nx
Hot paths	Go, Rust, gRPC, Swoole, FrankenPHP, async workers, task queues
Frontend	Vue.js, Nuxt, React, Next.js, Alpine.js, Tailwind CSS, web components
Mobile	React Native, Flutter, Dart, Expo, PWA
Commerce	Magento 2 / Adobe Commerce, PrestaShop, Shopify, BigCommerce
Data	MySQL, PostgreSQL, MongoDB, Redis, Elasticsearch, GraphQL, REST, RabbitMQ
Real time	WebSockets, WebRTC
Architecture	Domain-driven design, CQRS, microservices, event-driven systems, caching, load balancing
Delivery	Docker, Kubernetes, Ansible, AWS, GitHub Actions, GitLab CI/CD, observability, zero-downtime deploys

Leading and mentoring

- **Technical direction.** Designed solution architectures against business goals, then kept them intact through regular code review and hands-on guidance.
- **Team leadership.** Led development teams, owned planning, estimation and technical risk, and evaluated new technologies before the team adopted them.
- **Mentoring.** Pairing, structured code review, and handing engineers ownership of a domain rather than a ticket queue.
- **Standards.** Established coding standards and review rules across teams, and kept them enforced after the initial push.
- **Specification.** Technical specifications, diagrams and blueprints detailed enough for a team to build from without a round of clarifying meetings.

Credential

Adobe Certified Professional, Adobe Commerce Developer

Issued by Adobe, valid until June 2028. [Verify the credential](#)
